ABSTRACT

Antagonists of $\alpha 4$ integrin/ $\alpha 4$ integrin ligand adhesion, which inhibit the biological effects of such adhesion are described and methods for their use are
5 detailed. Such antagonists are useful in suppressing bone destruction associated with multiple myeloma. The homing of multiple myeloma cells to bone marrow and their $\alpha 4$ integrin-dependent release of bone-resorbing factors, resulting in bone destruction in patients with multiple
10 myeloma, is inhibited.
